

## Hydro-Flushing of Horizontal Drain Lines in Multi-Level Buildings

- Minimal Disruption
- Prevents Risk of Flooding
- Returns Drains to As-New Condition
- Camera Verification

Our system for cleaning multi-level building drains ensures:

- ☑ **Minimal disruption** to owners & tenants by mostly only requiring access to common areas and a few isolated parking stalls in underground garages.
- ☑ **Preventing the risk** of flooding.
- ☑ **The most thorough and long-lasting cleaning of drains possible** that returns drain systems to their as-new condition verified by drain camera.

The most common causes of blocked drain stacks are **grease, hair, and sticky foods** such as rice. All of these waste materials stick to the walls of drain piping, building up over time and eventually blocking the drain.

Conventional drain cleaning using snaking or augering can not remove these blockages effectively. This method only pushes a hole through the center of the blockage without removing the waste built up along the drain pipe walls.

### HYDRO FLUSHING DRAIN PIPES IN 4 EASY STEPS

1. We conduct a site survey to identify all your horizontal drains, the areas we require access to, and to put together a specific plan for your building. Following the survey, you will receive a final quote and plan of action. Upon approval, we begin ...
2. The piping will be opened and connected to our pump truck and on-board hydro-flusher in the parkade. This ensures the waste is completely removed and not sent further into your drain system where it can cause blockages further down the line.
3. The hydro-flusher with a drain cleaning head is run through the line, thoroughly removing all waste from the drain pipe walls which gets vacuumed into our pump truck. Working this way ensures we do not create blockages that can cause flooding. **If there is a problem in the stack or in a particular unit, localized flushing from the unit can be done afterwards, but 99% of these kinds of problems originate from waste build-up in the horizontal lines.**
4. The same process (steps 2 to 3) is repeated for each horizontal branch that leads to a stack or main drain. The result is a long lasting cleaning of your drain pipes with minimal disruption to owners & tenants.
